

Pavo Horse Grass Seed

Special grass seed mixture for paddocks

Many paddocks are sown with grass seed mixtures intended for cattle. These types of grass are not suitable for horses, which need more fibre and less protein. Paddocks need strong types of grass capable of withstanding trampling and resistant to the way in which horses graze. Horses crop grass much shorter than cows. Pavo grass seed produces a dense sward and contains healthy herbs with a high fibre content, making it ideal for horse pastures and paddocks.

Important characteristics

- low fructane index
- resistant to close cropping (low growing point)
- very dense sward, so better resistance to horses' hooves
- high resistance to crown rust, so the grass always tastes good to your horse
- contains specially selected herbs: including narrow-leaved plantain, fenugreek, wild carrot and parsley

Application

15 kg bags

Requirements per hectare:

- Initial seeding: 45-60 kg / ha
- Re-seeding: 30 kg / ha
